

I feel like there are a few good reasons for us to learn these languages and programs. One is to help patrons with their any questions that they might have. As library works, we are expected to help patrons with a lot of different tech questions, like how to download something, or how to set up an email account. I don't see why we couldn't help people if they have questions about setting up a website. It would be beneficial to have people on staff that could be there to help in the moment, instead of just sending people to find a specific book. We could be able to sit down and work with the person and be able to answer any questions right then and there.

Another reason that I thought of as to why this is important is that maybe we might work at a small library, or school, and if the website needs work, we'd be able to do something. Now, I'm assuming that many libraries have websites already set up with a website, but maybe the library starts a new program, and they want to put a page for the program. However, maybe there isn't enough money in the budget to outsource the work. But the library knows that the website is where most of the patrons go for library news. Having the skills to be able to update the website or add to it would be very beneficial for everyone.
